Chapter 1. Probability

Math 3215 Spring 2024

Georgia Institute of Technology

Section 1.
Properties of Probability

Why Probability and Statistics?

Two main reasons are uncertainty and complexity.

Uncertainty is all around us and is usually modeled as randomness: it appears in call centers, electronic circuits, quantum mechanics, medical treatment, epidemics, financial investments, insurance, games (both sports and gambling), online search engines, for starters.

Probability is a good way of quantifying and discussing what we know about uncertain things, and then making decisions or estimating outcomes.

1

Why Probability and Statistics?

Some things are too complex to be analyzed exactly (like weather, the brain, social science), and probability is a useful way of reducing the complexity and providing approximations.

We consider experiments for which the outcome cannot be predicted with certainty.

Such experiments are called random experiments.   ex)   Toss a fair coin

$$S = \{H, T\}$$

The collection of all possible outcomes is denoted by S and is called the sample space.

Given a sample space S, let A be a part of the collection of outcomes in S.

The subset A is called an event. $A = \{H\}$

Goal   "Quantify   "size" -f an event !
"uncertainty"

3

Example

$$S = \{1, 2, 3, 4, 5\}$$
$$A = \{1, 2\} \qquad , \qquad B = \{2, 3\}$$
$$A \cup B = \{1, 2, 3\} \qquad A \cap B = \{2\} \qquad A^c = \{3, 4, 5\}$$

Algebra of sets

Empty set (Null set): ϕ

A is a subset of B: $A \subset B$, Every outcome in A belongs to B.

The union of A and B = $A \cup B$ = the set of outcomes in A or outcomes in B

The intersection of A and B = $A \cap B$ = the set of outcomes in A and in B

The complements of A = A^c = the set of outcomes not in A

$A_1, A_2, \cdots, A_k$ are mutually exclusive events: Any pairs $A_i \cap A_j = \phi$

$A_1, A_2, \cdots, A_k$ are exhaustive events:
$$S = A_1 \cup A_2 \cup \cdots \cup A_k$$
Every outcome in S belongs to at least one of $A_1, \cdots, A_k$.

$A_1, A_2, \cdots, A_k$ are mutually exclusive and exhaustive events:

4

no outcome can belong to two subsets.

(Every outcome in S belong to at most one subset among $A_1, \cdots, A_k$
mutually exclusive : no overlap.

exhaustive : cover S

$\Rightarrow$ A partition !

Operation : $\cup$, $\cap$, Complement ; ...

Algebra of sets

Commutative Laws   1 op.   2 sets   Order doesn't matter.
$A \cup B = B \cup A$ and $A \cap B = B \cap A$

Associative Laws   1 op. twice, 3 sets   Parenthesis doesn't matter
$(A \cup B) \cup C = A \cup (B \cup C)$ and $(A \cap B) \cap C = A \cap (B \cap C)$

Distributive Laws   2 diff. op. $\cup / \cap$
$A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$ and $A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$

De Morgan's Laws   2 diff. op. $\cup$ + comp / $\cap$ + comp.
$(A \cup B)^c = A^c \cap B^c$ and $(A \cap B)^c = A^c \cup B^c$

5

"Heuristic"

Consider repeating the experiment a number of times, say, *n* times. We call these repetitions trials.

toss a fair coin   100 times

$S = \{H, T\}$, $A = \{H\}$

Count the number of times that event *A* actually occurred throughout these *n* trials; this number is called the frequency of event *A* and is denoted by $N(A)$. $= 48 \leftarrow$ # of H

$52 \leftarrow$ # of T

The ratio $N(A)/n$ is called the relative frequency of event *A* in these *n* repetitions of the experiment. "$\frac{48}{100} = 0.48$.

As *n* increase, one can expect that the relative frequency tends to stabilize, close to some number *p*.

This *p* is called the **probability of** *A*.

$n = 1000 \longrightarrow \frac{N(A)}{n} = \boxed{?}$

$n = 10000 \longrightarrow \frac{N(A)}{n} = ?$

$\vdots$

Converge

$\underline{P}$

6

$$\mathbb{P} : \{ \text{Sets \& Events} \} \xrightarrow{\text{assign}} \text{a number} \in [0, 1]$$

Definition

Probability is a real-valued set function $\mathbb{P}$ that assigns, to each event A in the sample space S, a number $\mathbb{P}(A)$, called the probability of the event A, such that the following properties are satisfied:

1. $\mathbb{P}(A) \geq 0$ for all events A
2. $\mathbb{P}(S) = 1$
3. For mutually exclusive events $A_1, A_2, \cdots$, $\mathbb{P}(A_1 \cup A_2 \cup \cdots) = \mathbb{P}(A_1) + \mathbb{P}(A_2) + \cdots$

(No overlap)

$$\mathbb{P}(\text{Union}) = \text{Sum of Each } \mathbb{P}( )$$
7

Example $S = \{ H, T \}$

$$\mathbb{P} : \begin{array}{l} \phi \longrightarrow 0 \\ \{H\} \longrightarrow \frac{1}{2} \left(\frac{1}{3} \right) \cancel{\times} \text{ Probability} \\ \{T\} \longrightarrow \frac{1}{2} \left(\frac{2}{3} \right) \cancel{\times} \\ \{H, T\} = S \longrightarrow 1 \end{array}$$

Theorem

Let A, B be events.

1. $\mathbb{P}(A) = 1 - \mathbb{P}(A^c)$
2. $\mathbb{P}(\varnothing) = 0$ $= 1 - \mathbb{P}(\phi^c) = 1 - \mathbb{P}(S) = 1 - 1 = 0$.
3. If $A \subset B$, then $\mathbb{P}(A) \leq \mathbb{P}(B)$.
   α special case $B = S$
4. $\mathbb{P}(A) \leq 1$ for all events A.

$P(S)$ $P(A^c)$

AC

A

$P(A)$

$P(A) + P(A^c) = P(S) = 1$

$P(A) = 1 - P(A^c)$.

$\Rightarrow$ $P(A) \leq P(B)$.

8
Definition of Probability

Possible Situations

A^c

$\boxed{T\ T}\ /2$

$\boxed{H\ H}\ /2$

$\frac{1}{2} \cdot \frac{1}{2} = \frac{1}{4}$

$T\ H\ H\ /3$

$H\ T\ T\ /3$

$\frac{1}{2} \cdot \frac{1}{2} = \frac{1}{4}$

$T\ H\ T\ T\ /4$

$H\ T\ H\ H\ /4$

$T\ H\ T\ H\ H\ /5$

$H\ T\ H\ T\ T\ /5$

$P(A) = 1 - P(A^c)$

$= 1 - \frac{1}{4} - \frac{1}{4} = \boxed{\frac{1}{2}}$

9

Event A

"Mutually Exclusive Sets" $\Rightarrow$ $\mathbb{P}(\text{Union}) = \text{Sum of } \mathbb{P}(\quad)$

Theorem

For events A, B, C,

Union / Sum

$$\mathbb{P}(A \cup B) = \mathbb{P}(A) + \mathbb{P}(B) - \mathbb{P}(A \cap B)$$

$\leftarrow$ overlap part.

$$\mathbb{P}(A \cup B \cup C) = \mathbb{P}(A) + \mathbb{P}(B) + \mathbb{P}(C)$$

$\leftarrow$ Sum

Union

$$\quad\quad - \mathbb{P}(A \cap B) - \mathbb{P}(B \cap C) - \mathbb{P}(C \cap A)$$

$\leftarrow$ overlaps

$$+ \mathbb{P}(A \cap B \cap C)$$

A   B

$A \cap B$

A

B

C

taken out too much

10

Example

Among a certain population of men, 30% are smokers, 40% are obese, and 25% are both smokers and obese.

Suppose we select a man at random from this population.

What is the probability that the selected man is either a smoker or obese?

$$A = \{ Smoker \}$$
$$B = \{ Obese \}$$

$$P(\underline{Either} \ Smoker \ \underline{Or} \ Obese)$$
$$\text{(AND)}$$

$$= P(A \cup B)$$
$$(\cap)$$

$$= P(A) + P(B) - P(A \cap B)$$
$$= P(Smoker) + P(Obese) - P(both)$$
$$= 0.3 + 0.4 - 0.25 = 0.45$$

$\{e_1, e_2\}$, $\{e_2, e_3\}$

not mutually exclusive

Probability with Equally likely outcomes

Let $S = \{e_1, e_2, ..., e_m\}$. Sample space finitely many outcomes

If each of these outcomes has the same probability of occurring, we say that the m

outcomes are equally likely.

In this case, $\mathbb{P}(A)$ is equal to

$$1 = \mathbb{P}(S) = \mathbb{P}(\{e_1, e_2, ..., e_m\})$$

$$= \mathbb{P}(\{e_1\} \cup \{e_2\} \cup \cdots \cup \{e_m\})$$

$$\underbrace{\phantom{= \mathbb{P}(\{e_1\} \cup \{e_2\} \cup \cdots \cup \{e_m\})}}_{\text{mutually exclusive events}}$$

$$= \mathbb{P}(\{e_1\}) + \mathbb{P}(\{e_2\}) + \cdots + \mathbb{P}(\{e_m\})$$

12

$$\mathbb{P}(\{e_1\}) = \cdots = \mathbb{P}(\{e_m\}) = \frac{1}{m} = \frac{1}{\#\text{ of total outcomes}}$$

In general A an event

with k outcomes

$$\mathbb{P}(A) = \frac{k}{m} = \frac{\#\text{ of outcomes in } A}{\#\text{ of total outcomes}}$$

Computing $\mathbb{P}(A)$ = Counting

Probability with Equally likely outcomes

Example

Let a card be drawn at random from an ordinary deck of 52 playing cards.

What is the probability that a king is drawn?

$$52 \quad cards \quad = \quad 13 \times 4$$

H : Ace, 2, 3, --- , 10, J, Q, K

D :

S :

C :

$$P(King) = \frac{Outcomes \ in \ A \ = \ 4}{total \ outcomes \ "52} = \frac{4}{52} = \frac{1}{13}.$$

Section 2.
Methods of Enumeration   =   Counting.

Suppose that an experiment E_1 has n_1 outcomes and, for each of these possible outcomes, an experiment E_2 has n_2 possible outcomes.

Then the composite experiment $E_1 E_2$ that consists of performing first E_1 and then E_2 has $n_1 n_2$ possible outcomes.

The **multiplication principle** can be extended to a sequence of more than two experiments or procedures.

E_1 : toss a coin $\{H, T\}$

E_2 : roll a die $\{1, 2, \cdots, 6\}$

14

$$
\begin{array}{c}
E_1 \qquad E_2 \\
\left\langle \begin{array}{c} H \left\langle \begin{array}{c} 1 \\ 2 \\ \vdots \\ 6 \end{array} \right. \\[2ex] T \left\langle \begin{array}{c} 1 \\ 2 \\ \vdots \\ 6 \end{array} \right. \end{array} \right.
\end{array}
$$

Total $= 12 = 2 \cdot 6$.

Example

A cafe lets you order a deli sandwich your way.

There are: E_1, six choices for bread; E_2, four choices for meat; E_3, four choices for cheese; and E_4, 12 different garnishes (condiments).

What is the number of different sandwich possibilities, if you may choose one bread, 0 or 1 meat, 0 or 1 cheese, and from 0 to 12 condiments?

$$E_1 \quad (\text{Bread}) \qquad n_1 = 6$$

$$E_2 \quad (\text{Meat}) \qquad n_2 = 1 + 4 = 5$$

$$E_3 \quad (\text{Chees}) \qquad n_3 = 1 + 4 = 5$$

$$E_4 \quad (\text{Condiments}) \qquad n_4 = 2 \cdot 2 \cdots 2 = 2^{12}$$

$\uparrow$

Consists of 12 experiments

Tomato : In / out   2
Olives   : in / out   2
Pickles : in / out   2
                         :

$$ANS = 6 \cdot 5 \cdot 5 \cdot 2^{12}.$$

Example

What is the number of the arrangements of four letters a, b, c, d?

ordered arrangement

Definition

Each of the arrangements (in a row) of n different objects is called a **permutation** of the n objects.

permutation

$\rightarrow a b c d$

$\rightarrow a b d c$

$\rightarrow a c b d$

$\vdots$

How many?

$E_1 \qquad E_2 \qquad E_3 \qquad E_4$

$\uparrow \qquad \uparrow \qquad \uparrow \qquad \uparrow$
$4 \qquad 3 \qquad 2 \qquad 1$

$\#$ permutation $= \quad 4 \cdot 3 \cdot 2 \cdot 1 = 4!$

In general,

n different objects

$\#$ of Permutation $= n \cdot (n-1) \cdots 1 = n!$

a b c d e   5 different letters

$n = 5$

Choose 2 .   ordered arrangement $r = 2$

<u>Ex</u>   a b
             a c   }   How many ?
             a d $20 = \dfrac{5!}{3!} = \dfrac{120}{6}$ │ 5 ← ×
   b c   │   4
             ⋮   │   ×
             ⋮   5−2 ?

Permutation

□ □ -- - □ $n - (r-1) = \underline{n-r+1}$
n $n-1$ ⑦
        └──────────────┘ r positions

If only r positions are to be filled with objects selected from n different objects, $r \leq n$,
then the number of possible ordered arrangements is $n \cdot (n-1) \cdots (n-r+1)$

$$= {}_nP_r$$

Definition
Each of the $_nP_r$, arrangements is called a permutation of n objects taken r at a time.

$${}_nP_r = \dfrac{n \cdot (n-1) \cdot \ \cdots \ (n-r+1)\,(n-r)(n-r-1) \ \cdots \ 2 \cdot 1}{(n-r)(n-r-1) \cdots 2 \cdot 1}$$

$$= \dfrac{n!}{(n-r)!}$$

17

Permutation

> **Example**
>
> What is the number of ways of selecting a president, a vice president, a secretary, and a treasurer in a club consisting of ten persons?

↑   ↑   ↑   ↑

10   9   8   7

ordered arrangement because distinct positions

$$10 \cdot 9 \cdot 8 \cdot 7 = \frac{10!}{6!}$$

Note : Choose 4 people as a committee member

     A   B   C   D

not different

A   B   D   C

n balls → *r* balls
Sampling

Suppose that a set contains *n* objects. Consider the problem of selecting *r* objects from this set.

- If *r* objects are selected from a set of *n* objects, and if the order of selection is noted, then the selected set of *r* objects is called an ordered sample of size *r*.

- Sampling with replacement occurs when an object is selected and then replaced before the next object is selected.

- Sampling without replacement occurs when an object is not replaced after it has been selected.

19

Sampling

Example

What are the number of ordered samples of five cards that can be drawn with/without replacement?

With Replacement

$$\uparrow \quad \uparrow \quad \uparrow \quad \uparrow \quad \uparrow$$
$$52 \quad 52 \quad 52 \quad 52 \quad 52$$

$$= \quad 52 \cdot 52 \cdot 52 \cdot 52 \cdot 52 = 52^5$$

20

Without Replacement

$$\uparrow \quad \uparrow \quad \uparrow \quad \uparrow \quad \uparrow$$
$$52 \quad 51 \quad 50 \quad 49 \quad 48$$

$$= \quad 52 \cdot 51 \cdot 50 \cdot 49 \cdot 48 = {}_{52}P_5 = \frac{52!}{47!}$$

Combination

Definition

Each of the unordered subsets of $\{1, 2, \cdots, n\}$ is called a **combination** of n objects taken r at a time.

Example   10 people $\longrightarrow$ Choose   4 people
                                                      for Committee.

10   4.

$N = \frac{\text{How many}}{\text{possible Committee}^{21}}$?

Idea

E_1 :   4 from 10 without order

a, b, c, d

$\boxed{N}$

E_2 :   Give order

$\square \quad \square \quad \square \quad \square$
$4 \quad\ 3 \quad\ 2 \quad\ 1$

$\boxed{4!}$

$\Rightarrow E_1 E_2$:   4 out of 10 with order

$= 10 \cdot 9 \cdot 8 \cdot 7 = \dfrac{10!}{6!} = \,_{10}P_4 = N \cdot 4!$

$$N = \frac{{}_{10}P_4}{4!} = \frac{10!}{6!\,4!} = \binom{10}{4} = {}_{10}C_4$$

$$\binom{n}{r} = \frac{n!}{r!\,(n-r)!} = \binom{n}{n-r}$$

Combination

The number of possible five-card hands (in five-card poker) drawn from a deck of 52 playing cards.

$$_{52}C_5 = \binom{52}{5} = \frac{52!}{5!\ 47!}$$

22

Example

4 Green balls
2 Red balls

How many ordered arrangement

$= ?$

$\downarrow$

Choose 2 spots for <u>Red</u>

Rest for Green

$= \binom{6}{2} = \dfrac{6!}{2!\,4!}$ "

Binomial Theorem

Binomial Theorem

$(a+b)^n = \sum_{k=0}^{n} \binom{n}{k} a^k b^{n-k}$

Suppose that a set contains n objects of two types: r of one type and $n-r$ of the other type.

The number of distinguishable arrangements is

$$\binom{n}{r} = \binom{n}{n-r}$$

$(a+b)^n = \underbrace{\overset{a/b}{(a+b)}\ \overset{a/b}{(a+b)}\ \cdots\ \overset{a/b}{(a+b)}}_{n \text{ times}}$

$\downarrow$ Expand

$\overset{\binom{n}{n}=1}{=} \ 1 \cdot a^n + n\, a^{n-1} b^1 + \cdots$

$+ \binom{n}{k} a^k \cdot b^{n-k}$

Choose a k times

b $(n-k)$ times

$= \binom{n}{n} a^n + \binom{n}{n-1} a^{n-1} b^1 + \binom{n}{n-2} a^{n-2} b^2 + \cdots$

23

Binomial Theorem

Multinomial coefficients

The coefficient of $a_1^{r_1} a_2^{r_2} \cdots a_s^{r_s}$ in the expansion of $(a_1 + \cdots + a_s)^n$ is

Section 3.
Conditional Probability

Example

Suppose that we are given 20 tulip bulbs that are similar in appearance and told that eight will bloom early, 12 will bloom late, 13 will be red, and seven will be yellow.

If one bulb is selected at random, the probability that it will produce a red tulip is

The probability that it will produce a red tulip given that it will bloom early is

New sample space ↑

	Early	Late	
Red	$a = 6$	$b = 7$	13
Yellow	$c = 2$	$d = 5$	7
	8	12	

$$P(\text{Red}) = \frac{13}{20} \quad , \quad P(\text{Yellow}) = \frac{7}{20} \quad , \quad P(\text{Early}) = \frac{8}{20}$$

$$P(\text{Late}) = \frac{12}{20}.$$

$$P(\text{Red when knowing Early}) = \frac{13}{20}? \quad \left(\frac{6}{8}?\right) = \frac{\#\text{ in R. and E.}}{\#\text{ in Early}}$$

$$= \frac{6}{8} = P(\text{Red} \mid \text{Early})$$

Conditional Probability

Definition

The conditional probability of an event A, given that event B has occurred, is defined by

$$\mathbb{P}(A|B) = \frac{\mathbb{P}(A \cap B)}{\mathbb{P}(B)}$$

provided that $\mathbb{P}(B) > 0$.

If Every outcome is Equally Likely,

$$P(A|B) = \frac{\# \text{ in } A \cap B / \# \text{ in } S}{\# \text{ in } B / \# \text{ in } S}$$

$$= \frac{P(A \cap B)}{P(B)} \, .$$

Conditional Probability

Example

If $\mathbb{P}(A) = 0.4$, $\mathbb{P}(B) = 0.5$, and $\mathbb{P}(A \cap B) = 0.3$, then $\mathbb{P}(A|B) =$

$$\mathbb{P}(A \mid B) \quad = \quad \frac{\mathbb{P}(A \wedge B)}{\mathbb{P}(B)} \quad = \quad \frac{0.3}{0.5} = 0.6$$

New Sample Space

16 outcomes.

Example

$$S = \{ (1,1), (1,2), (1,3), \cdots \}$$

Two fair four-sided dice are rolled and the sum is determined. Let A be the event that a sum of 3 is rolled, and let B be the event that a sum of 3 or a sum of 5 is rolled. The conditional probability that a sum of 3 is rolled, given that a sum of 3 or 5 is rolled, is

$$A = \{ (1,2), (2,1) \} = A \cap B$$

$$B = \{ (1,2), (2,1), (1,4), (2,3), (3,2), (4,1) \}$$

$$P(A \mid B) = \frac{\# \text{ in } A \cap B}{\# \text{ in } B} = \frac{2}{6} = \frac{1}{3}.$$

29

Def. of Probability $\mathbb{P} : \{ Events \} \to [0,1]$

$\begin{cases} ① & \mathbb{P}(A) \geqslant 0 \\ ② & \mathbb{P}(S) = 1 \\ ③ & A_1, A_2, \cdots \end{cases}$ Mutually Exclusive, $\mathbb{P}(\underline{Union}) = \mathbb{P}(A_1) + \mathbb{P}(A_2)$

Sum of $\mathbb{P}(\cdot)$

Properties of Conditional probabilities

$\mathbb{P}(A^c) = 1 - \mathbb{P}(A)$

Theorem

Suppose $\mathbb{P}(B) > 0$.

1. $\mathbb{P}(A|B) \geq 0$.
2. $\mathbb{P}(B|B) = 1$.
3. If $A_1, A_2, \cdots, A_k$ are mutually exclusive events, then

$$\mathbb{P}(A_1 \cup A_2 \cup \cdots \cup A_k|B) = \mathbb{P}(A_1|B) + \cdots + \mathbb{P}(A_k|B).$$

4. $\mathbb{P}(A^c|B) = 1 - \mathbb{P}(A|B)$.

30

$$\mathbb{P}(A \mid B) = \frac{\mathbb{P}(A \wedge B)}{\mathbb{P}(B)} \quad , \quad \mathbb{P}(B \mid A) = \frac{\mathbb{P}(A \wedge B)}{\mathbb{P}(A)}$$

The multiplication rule

The multiplication rule

The probability that two events, A and B, both occur is given by

$$\mathbb{P}(A \cap B) = \mathbb{P}(A|B)\mathbb{P}(B) = \mathbb{P}(B|A)\mathbb{P}(A).$$

$$A^C \cup B^C$$

$$= 1 - P(\overset{\text{''}}{(A \cap B)}{}^C) \qquad A^C \wedge B^C$$

$$P(A \cap B) = 1 - P(\text{Neither} \quad \text{Yellow}{}'')$$

The multiplication rule

$$P(A \wedge B^C) = P(B^C \mid A) \cdot P(A)$$

Example

At a county fair carnival game there are 25 balloons on a board, of which ten balloons are yellow, eight are red, and seven are green.

A player throws darts at the balloons to win a prize and randomly hits one of them.

Suppose the player throws darts twice.

What is the probability that the both balloons hit are yellow?

$$A = \{ 1^{st} = \text{Yellow} \} \qquad\qquad P(A) = \frac{10}{25} \qquad\qquad P(B \mid A^C)$$

$$B = \{ 2^{nd} = \text{Yellow} \} \qquad\qquad P(B) = \frac{9}{24} \; ? \qquad \frac{10}{24} \; ?$$

$$P(A \wedge B) = P(B \mid A) P(A) \qquad\qquad P(B \mid A)$$

$$= \frac{9^3}{24_8} \cdot \frac{10^2}{25_5} = \frac{3}{20} \, . \qquad\qquad P(A \mid B) = ?$$

$$P(B) = P(2^{nd} = Y) = P(1^{st} = Y, \; 2^{nd} = Y) + P(1^{st} \neq Y, \; 2^{nd} = Y)$$

$$= P(A \cap B) + P(A^C \wedge B)$$

$$= P(B \mid A) \cdot P(A) + P(B \mid A^C) \cdot P(A^C)$$

$$= \frac{9}{24} \cdot \frac{10}{25} + \frac{10}{24} \cdot \frac{15}{25} = \cdots$$

Example

A bowl contains seven blue chips and three red chips.

Two chips are to be drawn successively at random and without replacement.

Compute the probability that the first draw results in a red chip and the second draw results in a blue chip.

$$A = \{ 1^{st} = R \} \qquad , \qquad B = \{ 2^{nd} = B \}$$

$$\Rightarrow \quad P(A \cap B) = P(B|A) \cdot P(A) = \frac{7}{9_3} \cdot \frac{\cancel{3}}{10} = \frac{7}{30}$$

LoTP $\rightarrow \Big\{$

$$\boxed{P(B)} = P(A \cap B) + P(A^c \cap B) = \frac{7}{30} + \frac{\cancel{6}^2}{9_3} \cdot \frac{7}{10}$$

$$P(A|B) = \frac{P(A \cap B)}{P(B)}$$

$$= \frac{7 + 2 \cdot 7}{30} = \frac{7}{10}$$

Beyes' rule

$$= \frac{1}{3} \cdot$$

$$P(A^c \cap B) = \underbrace{P(B|A^c)}_{\text{``} \frac{6}{9}} \cdot \underbrace{P(A^c)}_{\text{``} \frac{7}{10}}$$

33

The multiplication rule

Multiplication rule for three events

$$\mathbb{P}(A \cap B \cap C) = \mathbb{P}(A)\mathbb{P}(B|A)\mathbb{P}(C|A \cap B).$$

The multiplication rule

Example

Four cards are to be dealt successively at random and without replacement from an ordinary deck of playing cards.

The probability of receiving, in order, a spade, a heart, a diamond, and a club is

$$1^{st} \qquad 2^{nd} \qquad 3^{rd} \qquad 4^{th}$$
$$\|\qquad \|\qquad \|\qquad \|$$
$$A \qquad B \qquad C \qquad D$$
$$P(A \cap B \cap C \cap D)$$

$$= P(A) \cdot P(B \mid A) \cdot P(C \mid (A \cap B)) \, P(D \mid A \cap B \cap C)$$

$$= \frac{13}{52} \cdot \frac{13}{51} \cdot \frac{13}{50} \cdot \frac{13}{49} \cdot$$

35

$$\mathbb{P}(A) = \mathbb{P}(A \wedge B) + \mathbb{P}(A \wedge B^c)$$

$$A = (A \wedge B) \cup (A \wedge B^c)$$

$A \wedge B^c$ A B $A \wedge B$

The multiplication rule

Example

A boy has five blue and four white marbles in his left pocket and four blue and five white marbles in his right pocket.

If he transfers one marble at random from his left to his right pocket, what is the probability of his then drawing a blue marble from his right pocket?

$$\begin{bmatrix} 5\,B \\ \\ 4\,W \end{bmatrix} \xrightarrow{\text{Choose } 1} \begin{bmatrix} 4B \\ 5W \end{bmatrix} + \boxed{?} \xrightarrow[1]{\text{Choose}} \; \text{"Blue"} \quad \text{(A)}$$

Left   Right

$A = \{\; \text{Blue from Right} \}$ $B = \{\; \boxed{?} = \text{Blue} \}$

$$\mathbb{P}(A) = \mathbb{P}(B \wedge A) + \mathbb{P}(B^c \wedge A)$$

$$= \underbrace{\mathbb{P}(A \mid B)}_{\text{"} \tfrac{5}{10}} \cdot \underbrace{\mathbb{P}(B)}_{\text{"} \tfrac{5}{9}} + \underbrace{\mathbb{P}(A \mid B^c)}_{\text{"} \tfrac{4}{10}} \cdot \underbrace{\mathbb{P}(B^c)}_{\text{"} \tfrac{4}{9}}$$

$\begin{bmatrix} 5B \\ 5W \end{bmatrix}$ $\begin{bmatrix} 4\,B \\ 6\,W \end{bmatrix}$

$$= \frac{5 \cdot 5 + 4 \cdot 4}{90} = \frac{41}{90}$$

Section 4.

Independent Events

Independent Events

For certain pairs of events, the occurrence of one of them may or may not change the probability of the occurrence of the other.

In the latter case, they are said to be independent events.

Example

Flip a coin twice.

Let $A =$ heads on the first flip and $B =$ tails on the second flip.

Compute $\mathbb{P}(B|A)$ and $\mathbb{P}(B)$.

Equally Likely Outcomes

$$S = \{ (H,H) \; (H,T) \; , \; (T,H) \; , \; (T,T) \}$$

$$A = \{ 1^{st} = H \} \quad = \quad \{ (H,H) \; , \; (H,T) \}$$

$$B = \{ 2^{nd} = T \} \quad = \quad \{ (H,T) \; , \; (T,T) \}$$

38

$$\mathbb{P}(B|A) = \frac{\# \text{ of } A \wedge B}{\# \text{ of } A} \quad = \quad \frac{1}{2}$$

$$A \wedge B = \{ (H,T) \}$$

$$\mathbb{P}(B) = \frac{\# \text{ of } B}{\# \text{ of } S} \quad = \quad \frac{2}{4} = \frac{1}{2}.$$

$$\Rightarrow \quad \mathbb{P}(B|A) = \mathbb{P}(B)$$

$$\mathbb{P}(A|B) = \mathbb{P}(A)$$

$$\frac{\mathbb{P}(A \cap B)}{\mathbb{P}(B)} = \mathbb{P}(A \mid B) = \mathbb{P}(A) \qquad \Rightarrow \qquad \mathbb{P}(A \cap B) = \mathbb{P}(A) \cdot \mathbb{P}(B)$$

$$\frac{\mathbb{P}(B \cap A)}{\mathbb{P}(A)} = \mathbb{P}(B \mid A) = \mathbb{P}(B) \qquad \qquad \underline{\underline{Def}} \text{ "}$$

$$\mathbb{P}(A \mid B) = \mathbb{P}(A) \qquad \Rightarrow \qquad \boxed{\mathbb{P}(A \cap B) = \mathbb{P}(A) \cdot \mathbb{P}(B)}$$

$$\underbrace{\qquad\qquad\qquad}_{\mathbb{P}(B) \neq 0} \qquad\qquad\qquad\qquad\qquad \text{no constraint.}$$

Independent Events

> **Definition: Independence**
>
> Events A and B are **independent** if and only if $\mathbb{P}(A \cap B) = \mathbb{P}(A)\mathbb{P}(B)$.
>
> Otherwise, A and B are called **dependent events**.

39

6 - faced

Example

A red die and a white die are rolled.

Let $A = \{$red is $4\}$ and $B = \{$sum is odd$\}$.

Are they independent?

$$P(A \cap B) = \frac{3}{36} = \frac{1}{12} = \frac{1}{2} \cdot \frac{1}{6} = P(A) \cdot P(B) .$$

$$P(A) = 1/6$$

$$P(B) = \frac{18}{36} = \frac{1}{2}$$

$$S = \{ (1,1), (1,2), (1,3), \cdots \}_{36 \text{ outcomes}}$$

$$B = \{ (1, 2 \text{ or } 4 \text{ or } 6), (2, 1 \text{ or } 3 \text{ or } 5) $$
$$(3, 2 \text{ or } 4 \text{ or } 6), \cdots \}_{18 \text{ outcomes}}$$

$$A \cap B = \{ (4, 1 \text{ or } 3, \text{ or } 5) \}_{3 \text{ outcomes}}$$

$$A, B \quad \text{are} \quad \text{Indep.}$$

40

Independent Events

Example

A red die and a white die are rolled.

Let $A = \{\text{red is } 5\}$ and $B = \{\text{sum is } 11\}$.

$B = \{(5,6), (6,5)\}$

Are they independent?

$$P(A) = \frac{1}{6} \qquad\qquad P(B) = \frac{1}{18} = \frac{2}{36}$$

$$P(A \cap B) = \frac{1}{36} \neq \frac{1}{6} \cdot \frac{1}{18} = P(A) \cdot P(B)$$

41

Theorem

If A and B are independent, then the following pairs are independent:

- A and B^c
- A^c and B
- A^c and B^c

Proof

We know $P(A \cap B) = P(A) \cdot P(B)$.

Need to show : $P(A \cap B^c) = P(A) \cdot P(B^c)$.

$$P(A \cap B^c) + P(A \cap B) = P(A)$$

$$P(A \cap B^c) = P(A) - P(A) \cdot P(B)$$

$$= P(A) \cdot (1 - P(B))$$

$$= P(A) \cdot P(B^c)$$

S

A B

$A \cap B$

$A \cap B^c$

42

Definition: Mutually independence

Events A, B, and C are **mutually independent** if and only if A, B, and C are pairwise independent and

$$= \begin{pmatrix} A, B & \text{indep} \\ B, C & \text{indep} \\ C, A & \text{indep} \end{pmatrix} \qquad \mathbb{P}(A \cap B \cap C) = \mathbb{P}(A)\mathbb{P}(B)\mathbb{P}(C).$$

In other words

$\qquad\qquad A, B, C \qquad$ mutually indep

$\qquad \Longleftrightarrow \left\{ \begin{array}{l} P(A \cap B) = P(A)\, P(B) \\ P(B \cap C) = P(B)\, P(C) \\ P(C \cap A) = P(C)\, P(A) \end{array} \right\} \Longleftrightarrow \begin{array}{l} A, B, C \\ \text{pairwise} \\ \text{independent.} \end{array}$

$\qquad\qquad\qquad P(A \cap B \cap C) = P(A)\, P(B)\, P(C)$

<u>Note</u>

$\qquad$ mutually indep $\qquad \Longrightarrow \qquad$ Pairwise Indep

$\qquad\qquad\qquad\qquad\qquad \nLeftarrow$

$\qquad\qquad\qquad\qquad\qquad \underline{\text{Example}} \quad \text{``Exercise.}$

43

$$\{ \text{Two Find Defect} \} = (A \cap B \cap C^{c}) \cup (A \cap B^{c} \cap C)$$
$$\cup (A^{c} \cap B \cap C)$$

$A \cap B \cap C^{c}$

$A \cap B^{c} \cap C$

B

A

C

$A^{c} \cap B \cap C$
Independent Events

Example

Three inspectors look at a critical component of a product. $P(A)$ $P(B)$ $P(C)$

$\parallel$ $\parallel$ $\parallel$

Their probabilities of detecting a defect are different, namely, 0.99, 0.98, and 0.96, respectively. Assume independence.

Compute the following probabilities:

(a) that exactly two find the defect, and

(b) that all three find the defect.

indep ?

why?   mutually exclusive.

$P(\text{Two Find Defect})$

$$= P(A \cap B \cap C^{c}) + P(A \cap B^{c} \cap C) + P(A^{c} \cap B \cap C)$$

44

$$\underset{\underset{indep}{\uparrow}}{=} P(A) \cdot P(B) \cdot P(C^{c}) + P(A) \cdot P(B^{c}) P(C)$$

$$+ P(A^{c}) P(B) P(C)$$

$$= 0.99 \cdot 0.98 \cdot (1 - 0.96) + \cdots$$

Section 5.
Bayes' Theorem "+ Law of Total Prob".

Recall

← Event from 2nd action
$$A = (A \cap B) \cup (A \cap B^c)$$
$$P(A) = P(A \cap B) + P(A \cap B^c)$$
$$= P(A \mid B) P(B) + P(A \mid B^c) \cdot P(B^c)$$

B, B^c : mutually Exclusive + Exhaustive

Extend

The law of total probabilities

$$A = (A \cap B_1) \cup (A \cap B_2) \cup \cdots \cup (A \cap B_n)$$
$$\Rightarrow P(A) = P(A \cap B_1) + P(A \cap B_2) + \cdots + P(A \cap B_n)$$

The law of total probabilities

If $B_1, \cdots, B_n$ are mutually exclusive and exhaustive events (partition), then

$$\mathbb{P}(A) = \sum_{k=1}^{n} \mathbb{P}(A \cap B_k) = \sum_{k=1}^{n} \mathbb{P}(A|B_k)\mathbb{P}(B_k).$$

$$P(A) = P(A \mid B_1) \cdot P(B_1) + P(A \mid B_2) P(B_2) + \cdots + P(A \mid B_n) \cdot P(B_n)$$

↑
LoTP

45

$$P(B_1 \mid A) = \frac{P(A \cap B_1)}{P(A)}$$

$$\underset{\uparrow}{=} \frac{P(A \mid B_1) P(B_1)}{P(A \mid B_1) \cdot P(B_1) + P(A \mid B_2) P(B_2) + \cdots + P(A \mid B_n) \cdot P(B_n)}$$

Bayes' Thm.

Bayes' Theorem

$$\mathbb{P}(B_k|A) = \frac{\mathbb{P}(A \cap B_k)}{\mathbb{P}(A)} = \frac{\mathbb{P}(B_k)\mathbb{P}(A|B_k)}{\mathbb{P}(A)} = \frac{\mathbb{P}(B_k)\mathbb{P}(A|B_k)}{\sum_{k=1}^{n} \mathbb{P}(A|B_k)\mathbb{P}(B_k)}.$$

multiplication Rule

Def

LoTP

46

Example

In a certain factory, machines I, II, and III are all producing springs of the same length.

Of their production, machines I, II, and III respectively produce 2%, 1%, and 3% defective springs.

Of the total production of springs in the factory, machine I produces 35%, machine II produces 25%, and machine III produces 40%.

If the selected spring is defective, what is the conditional probability that it was produced by machine III?

$$A = \{ \text{Defective} \}$$

$$B_1 = \{ \text{From Machine I} \} \qquad B_2 = \{ \text{From II} \}, \qquad B_3 = \{ \text{From III} \}$$

47

$$P(B_3 \mid A)$$

$$\begin{cases} P(B_1) = 0.35 & P(B_2) = 0.25 & P(B_3) = 0.4 \\ P(A \mid B_1) = 0.02 & P(A \mid B_2) = 0.01 & , \quad P(A \mid B_3) = 0.03 \end{cases}$$

$$= \frac{P(A \cap B_3)}{P(A \cap B_1) + P(A \cap B_2) + P(A \cap B_3)}$$

$$= \frac{P(A \mid B_3) \cdot P(B_3)}{P(A \mid B_1) P(B_1) + P(A \mid B_2) P(B_2) + P(A \mid B_3) P(B_3)} = \ldots$$

Example

Bowl B_1, contains two red and four white chips, bowl B_2 contains one red and two white chips, and bowl B_3 contains five red and four white chips.

Choose one of three bowls with $\mathbb{P}(B_1) = 1/3$, $\mathbb{P}(B_2) = 1/6$, and $\mathbb{P}(B_3) = 1/2$ and draw a chip from the chosen bowl.

Let R be the event that a red chip is chosen.

Compute $\mathbb{P}(R)$ and $\mathbb{P}(B_1|R)$.

$$\mathbb{P}(R) = \mathbb{P}(B_1 \cap R) + \mathbb{P}(B_2 \cap R) + \mathbb{P}(B_3 \cap R)$$

$$= \mathbb{P}(B_1)\,\mathbb{P}(R|B_1) + \mathbb{P}(B_2)\,\mathbb{P}(R|B_2) + \mathbb{P}(B_3)\,\mathbb{P}(R|B_3)$$

$$= \frac{1}{3} \cdot \frac{2}{6} + \frac{1}{6} \cdot \frac{1}{3} + \frac{1}{2} \cdot \frac{5}{9} = \frac{2+1+5}{18} = \frac{8}{18}$$

(annotation: 48)

$$\mathbb{P}(B_1|R) = \frac{\mathbb{P}(B_1 \cap R)}{\mathbb{P}(R)} = \frac{2/18}{8/18} = \frac{1}{4}.$$

(handwritten annotations: "6" above B_1, "3" above B_3, "9" above $1/3$)
