## Continuous Random Variables

Let the random variable  $X$  denote the outcome when a point is selected at random from an interval  $[0, 1]$ .

If the experiment is performed in a fair manner, it is reasonable to assume that the probability that the point is selected from an interval  $[\frac{1}{3}, \frac{1}{2}]$  is

The CDF of  $X$  is

## Definition

We say a random variable  $X$  on a sample space  $S$  is a continuous random variable if there exists a function  $f(x)$  such that

- $f(x) \geq 0$  for all  $x$ ,
- $\int_{S(X)} f(x) dx = 1$ , and
- For any interval  $(a, b) \subset \mathbb{R}$ ,

$$\mathbb{P}(a < X < b) = \int_a^b f(x) dx.$$

The function  $f(x)$  is called **the probability density function (PDF)** of  $X$ .

## Continuous Random Variables

The CDF of  $X$  is

The expectation (mean) of  $X$  is

The variance of  $X$  is

The standard deviation of  $X$  is

The moment generating function of  $X$  is

## Properties

The PMF of a discrete random variable is bounded by 1. But for PDF,  $f(x)$  can be greater than 1.

For CDF  $F$ , we have  $F'(x) = f(x)$  where  $F$  is differentiable at  $x$ .

## Example

Let  $X$  be a continuous random variable with a PDF  $g(x) = 2x$  for  $0 < x < 1$ .

Find the CDF and the expectation.

## Example

Let  $X$  have the PDF  $f(x) = xe^{-x}$ . Find the MGF.

## Definition

$X$  is a uniform random variable if its PDF is constant on its support.

If its support is  $[a, b]$ , then the PDF is

We denote by  $X \sim U(a, b)$ .

## Theorem

If  $X \sim U(a, b)$ , then

$$\mathbb{E}[X] =$$

$$\text{Var}[X] =$$

$$M(t) =$$

### Example

If  $X$  is uniformly distributed over  $(0, 10)$ , calculate  $\mathbb{P}(X < 3)$ ,  $\mathbb{P}(X > 6)$ , and  $\mathbb{P}(3 < X < 8)$ .

# Uniform Random Variables

## Example

A bus travels between the two cities A and B, which are 100 miles apart.

If the bus has a breakdown, the distance from the breakdown to city A has a  $U(0, 100)$  distribution.

There are bus service stations in city A, in B, and in the center of the route between A and B.

It is suggested that it would be more efficient to have the three stations located 25, 50, and 75 miles, respectively, from A.

Do you agree? Why?

**The  $(100p)$ -th percentile** is a number  $\pi_p$  such that  $F(\pi_p) = p$ .

For example, the 50th percentile is the number  $\pi_{\frac{1}{2}} = q_2$  such that  $F(\pi_{\frac{1}{2}}) = \frac{1}{2}$  and this is called the median.

The 25th and 75th percentiles are called the first and third quartiles, respectively, and are denoted by  $q_1 = \pi_{0.25}$  and  $q_3 = \pi_{0.75}$ .

## Example

Let  $X$  be a continuous random variable with PDF  $f(x) = |x|$  for  $-1 < x < 1$ . Find  $q_1, q_2, q_3$ .

Let  $f(x) = c\sqrt{x}$  for  $0 \leq x \leq 4$  be the PDF of a random variable  $X$ .

Find  $c$ , the CDF of  $X$ , and  $\mathbb{E}[X]$ .

## **Section 2.**

# **The Exponential, Gamma, and Chi-Square Distributions**

---

## Exponential random variables

Consider a Poisson random variable  $X$  with parameter  $\lambda$ .

This represents the number of occurrences in a given interval, say  $[0, 1]$ .

If  $\lambda = 5$ , that means the expected number of occurrences in  $[0, 1]$  is 5.

Let  $W$  be the waiting time for the first occurrence. Then,

$$\mathbb{P}(W > t) = \mathbb{P}(\text{no occurrences in } [0, t]) =$$

for  $t > 0$ .

# Exponential random variables

## Definition

We say  $X$  is **an exponential random variable** with parameter  $\lambda$  (or mean  $\theta$  where  $\lambda = \frac{1}{\theta}$ ) if its pdf is

$$f(x) = \lambda e^{-\lambda x}$$

for  $x \geq 0$  and otherwise 0. Here,  $\lambda$  is the parameter and  $\theta$  is the mean.

# Exponential random variables

## Theorem

Suppose that  $X$  is an exponential random variable with parameter  $\lambda = \frac{1}{\theta}$ .

$$\mathbb{E}[X] = \frac{1}{\lambda} = \theta$$

$$\text{Var}[X] = \frac{1}{\lambda^2} = \theta^2$$

$$M(t) = \frac{\lambda}{\lambda - t} = \frac{1}{1 - \theta t}$$

### Example

Let  $X$  have an exponential distribution with a mean  $\theta = 20$ .

Find  $\mathbb{P}(X < 18)$ .

# Exponential random variables

## Example

Customers arrive in a certain shop according to an approximate Poisson process at a mean rate of 20 per hour.

What is the probability that the shopkeeper will have to wait more than five minutes for the arrival of the first customer?

## Gamma random variables

Consider a Poisson random variable  $X$  with  $\lambda$ .

Let  $W$  be the waiting time until  $\alpha$ -th occurrences, then its CDF is

$$F(t) = \mathbb{P}(W \leq t) = 1 - \mathbb{P}(W > t) = 1 - \sum_k^{\alpha-1} \frac{(\lambda t)^k e^{-\lambda t}}{k!}.$$

Thus, the PDF is

$$f(x) = \frac{\lambda(\lambda x)^{\alpha-1}}{(\alpha-1)!} e^{-\lambda x}.$$

This random variable is called **a gamma random variable** with  $\lambda$  and  $\alpha$  where  $\lambda = \frac{1}{\theta} > 0$ .

This can be extended to non-integer  $\alpha > 0$ .

## Gamma functions

The gamma function is defined by

$$\Gamma(t) = \int_0^{\infty} y^{t-1} e^{-y} dy$$

for  $t > 0$ .

By integration by parts, we have

## Gamma functions

In particular,  $\Gamma(1) =$

$\Gamma(2) =$

$\Gamma(3) =$

$\Gamma(n) =$

for integers  $n$ .

## Theorem

$$\mathbb{E}[X] = \frac{\alpha}{\lambda}$$

$$\text{Var}[X] = \frac{\alpha}{\lambda^2}$$

$$M(t) = \frac{1}{(1-\theta t)^\alpha} \text{ for } t \leq \frac{1}{\theta}.$$

### Example

Suppose the number of customers per hour arriving at a shop follows a Poisson random variable with mean 20.

That is, if a minute is our unit, then  $\lambda = \frac{1}{3}$ .

What is the probability that the second customer arrives more than five minutes after the shop opens for the day?

## Chi-square distribution

Let  $X$  have a gamma distribution with  $\theta = 2$  and  $\alpha = r/2$ , where  $r$  is a positive integer.

The pdf of  $X$  is

$$f(x) = \frac{1}{\Gamma(\frac{r}{2})2^{\frac{r}{2}}} x^{\frac{r}{2}-1} e^{-\frac{x}{2}}$$

for  $x > 0$ .

We say that  $X$  has **a chi-square distribution** with  $r$  degrees of freedom and we use the notation  $X \sim \chi^2(r)$ .

## Exercise

Let  $X$  have an exponential distribution with mean  $\theta$ .

Compute  $\mathbb{P}(X > 15 | X > 10)$  and  $\mathbb{P}(X > 5)$ .

**Section 3.**

**The Normal Distribution**

---

## Definition

We say  $X$  is a **Gaussian random variable** or has a **normal distribution** if its PDF is given by

$$f(x) = \frac{1}{\sigma\sqrt{2\pi}} \exp\left(-\frac{(x-\mu)^2}{2\sigma^2}\right).$$

Here  $\mu$  is the mean and  $\sigma$  is the standard deviation. We use the notation  $X \sim N(\mu, \sigma^2)$ .

## Theorem

$$\int_{\mathbb{R}} f(x) dx = 1$$

$$\mathbb{E}[X] = \mu$$

$$\text{Var}[X] = \sigma^2$$

$$M(t) = \exp\left(\mu t + \frac{\sigma^2 t^2}{2}\right)$$

## Standard normal distribution

In particular, if  $\mu = 0$  and  $\sigma = 1$ , then  $Z \sim N(0, 1)$  is called **the standard normal random variable**.

### Example

Let  $Z$  is  $N(0, 1)$ .

Find  $\mathbb{P}(Z \leq 1.24)$ ,  $\mathbb{P}(1.24 \leq Z \leq 2.37)$ , and  $\mathbb{P}(-2.37 \leq Z \leq -1.24)$ .

## Theorem

If  $X \sim N(\mu, \sigma^2)$ , then  $Z = \frac{X - \mu}{\sigma}$  is the standard normal.

## Example

Let  $X \sim N(3, 16)$ .

Find  $\mathbb{P}(4 \leq X \leq 8)$ ,  $\mathbb{P}(0 \leq X \leq 5)$ , and  $\mathbb{P}(-2 \leq X \leq 1)$ .

### Example

Let  $X \sim N(25, 36)$ .

Find a constant  $c$  such that  $\mathbb{P}(|X - 25| \leq c) = 0.9544$ .

### Theorem

If  $Z$  is the standard normal, then  $Z^2$  is  $\chi^2(1)$ .

## **Section 4.**

# **Additional Models**

---

Recall the postulates of an approximate Poisson:

- The numbers of occurrences in nonoverlapping subintervals are independent.
- The probability of two or more occurrences in a sufficiently short subinterval is essentially zero.
- The probability of exactly one occurrence in a sufficiently short subinterval of length  $h$  is approximately  $\lambda h$ .

## Weibull distribution

One can think the event occurrence as a failure and so  $\lambda$  can be understood as the failure rate.

Poisson distribution and its waiting time (exponential distribution) has a constant failure rate.

Sometimes, it is more natural to choose  $\lambda$  as a function of  $t$  in the last assumption.

Then the waiting time  $W$  for the first occurrence satisfies

$$\mathbb{P}(W > t) = \exp\left(-\int_0^t \lambda(w) dw\right).$$

## Definition

If  $\lambda(t) = \alpha \frac{t^{\alpha-1}}{\beta^\alpha}$ , then the waiting time  $W$  for the first occurrence has the density

$$g(t) = \lambda(t) \exp\left(-\int_0^t \lambda(w) dw\right) = \alpha \frac{t^{\alpha-1}}{\beta^\alpha} \exp\left(-\left(\frac{t}{\beta}\right)^\alpha\right).$$

$W$  is called **the Weibull random variable**.

### Example

If  $\lambda(t) = 2t$ , then the waiting time  $W$  has the density

and it is a Weibull random variable with  $\alpha =$     and  $\beta =$     .

If  $W_1, W_2$  are independent Weibull with  $\alpha$  and  $\beta$  above, is the minimum of  $W_1, W_2$  Weibull?

### Theorem

The mean of  $W$  is  $\mu = \beta\Gamma(1 + \frac{1}{\alpha})$ .

The variance is  $\sigma^2 = \beta^2 (\Gamma(1 + \frac{2}{\alpha}) - \Gamma(1 + \frac{1}{\alpha})^2)$ .

### Example

Suppose  $X$  has a CDF

$$F(x) = \begin{cases} 0, & x < 0 \\ \frac{x^2}{4}, & 0 \leq x < 1 \\ \frac{1}{2}, & 1 \leq x < 2 \\ \frac{x}{3}, & 2 \leq x < 3 \\ 1, & x \geq 3. \end{cases}$$

Find  $\mathbb{P}(0 < X < 1)$ ,  $\mathbb{P}(0 < X \leq 1)$ , and  $\mathbb{P}(X = 1)$ .

## Mixed type random variables

### Example

Consider the following game: A fair coin is tossed.

If the outcome is heads, the player receives \$2.

If the outcome is tails, the player spins a balanced spinner that has a scale from 0 to 1.

The player then receives that fraction of a dollar associated with the point selected by the spinner.

Let  $X$  be the amount received. Draw the graph of the cdf  $F(x)$ .

## Exercise

The cdf of  $X$  is given by

$$F(x) = \begin{cases} 0, & x < -1 \\ \frac{x}{4} + \frac{1}{2}, & -1 \leq x < 1 \\ 1, & x \geq 1. \end{cases}$$

Find  $\mathbb{P}(X < 0)$ ,  $\mathbb{P}(X < -1)$ , and  $\mathbb{P}(-1 \leq X < \frac{1}{2})$ .
